

Redesigning a **Public Service Platform** for Enhanced UX & Accessibility

A strategic UX blueprint detailing wireframing, high-fidelity Figma prototyping, and usability evaluations as structured in **Presentation1.pdf**.

Prepared By: Potharaju Preetham Kumar | **Role:** UX/UI Designer & Researcher | **Phase:** Capstone Submission

01. Project Objectives & Vision

Establishing the strategic vision, foundational UX pillars, and structural goals for the newly redesigned portal.

Core Redesign Objectives

Empathetic Accessibility

Enforce strict visual contrast, clear typographic scale, and logical hierarchy to support citizens facing physical or digital literacy challenges, especially the elderly.

Frictionless Navigation

Consolidate bloated structural menus into clear, task-oriented action pathways that reduce the time and effort required to locate vital services.

Primary Persona: Ravi Kumar

Age 65 • Retired Teacher • Moderate Digital Literacy

- ✓ **Primary Goals:** Instantly check notifications, pay monthly utility bills, and securely apply for certificates without help.
- ✗ **Critical Challenges:** Strained by small layout text, easily overwhelmed by cluttered nested menus, and prone to administrative anxiety without clear confirmation tracking.

Critical Platform Pain Points

Menu Clutter

Bloated directories made essential public services exceptionally difficult to locate, causing extreme fatigue.

Confusing Forms

Endless vertical forms lacked step indicators, leading to user drop-off and incomplete entries.

Blind Tracking

No clean dashboard updates on pending submittals triggered administrative anxiety and helpline backlog.

02. Architecture & Prototyping

A deep-dive into the simplified Information Architecture and the 3-Frame High-Fidelity Prototype constructed inside Figma.

Figma Component & Layer Blueprint

To address constraints flagged in our design specifications, we mapped a structured 3-frame flow directly in Figma: **Dashboard**, **Service Application**, and **Tracking**.

By strictly nesting text assets within parent frames and establishing direct button component layers, we ensured absolute visual continuity across the prototype viewport.

Ideation topics overview

Ideation topic pag

Simplified Information Architecture

-  **Integrated Utility Header:** Hosts the prominent portal identity alongside a global search bar and persistent accessibility controls.
-  **Task-Oriented Core Grid:** Groups critical citizen utilities like Birth Certificates, Income Certificates, Utility Payments, and Licenses.
-  **Direct Action Blocks:** Positions the Automated Help Center and Application Tracking components directly at the base of the page.

Post-Debugging Usability Metrics

100%

Task Success Rate

Securing Flawless Flow Metrics

By executing strict layer alignment in Figma, we resolved critical rendering errors where loose elements floated outside parent canvas bounds during prototype test runs.

Users can now smoothly navigate the portal, fill the progressive steps, and securely hit the **[submit]** call-to-action to access the automated confirmation page.

Iterative Debugging & Testing Log

Identified Bug	User Testing Impact	Technical Root Cause	Implemented Resolution
Loose Submit Text	Form submit button appeared completely blank in view.	T [submit] was placed at canvas root outside the form frame.	Locked layer inside parent form frame, directly over vector.
Orphan Dashboard Layer	No navigation metrics or header elements visible.	Text group floated outside active viewport boundaries.	Aligned coordinates and established strict frame containment.
Unresponsive Actions	Older users struggled to hit targets in prototype preview.	Text elements sat ungrouped without clickable bounding boxes.	Grouped text over high-contrast bounding shapes (56px minimum height).

The End-to-End User Experience

Questions & Answers

The redesigned public service platform delivers exceptional UX, ensures compliance with universal accessibility standards, and eliminates complex menu friction.
